These data were used to develop a map and a database of water levels that were measured in wells completed in basalt, granite, or slate, or in wells that were not surveyed with a differential GPS. Elevations were determined from levels surveyed from fractured zones within these rocks can transmit useable amounts of ground water.

The SVRP aquifer is underlain and laterally bounded by units of relatively low permeability, including sandstone, siltstone, and shale. The thickness of the SVRP aquifer generally is unknown except along its margins where wells have been drilled to test the water levels. The recent aquifer-related documents have used a modified version of the original Spokane Valley–Rathdrum Prairie map.
