

### **Changes in Documents Distributed for Aug. 6<sup>th</sup>, HHC Negotiated Rulemaking Meeting.**

Subsequent to our meeting it was discovered that EPA's 2014 proposed RSC rather than their 2015 final RSC values were used in Idaho's deterministic criteria calculations. This affects the calculations for 4 compounds:

2-Chloronaphtlalene	RSC changed from 0.2 to 0.8
Gamma-BHC (Lindane)	RSC changed from 0.2 to 0.5
Endrin	RSC changed from 0.2 to 0.8
Endrin Aldehyde	RSC changed from 0.2 to 0.8

Although changing the deterministic criteria presented in our "Human Health Criteria Comparison Table" this does not change the criteria values in the preliminary draft rule.

We also discovered that PRA criteria values for 2 compounds, Dieldrin and Hexachlorobutadiene, were left out of the "Human Health Criteria Comparison Table". Although absent from the comparison table these values had been carried forward into the preliminary draft rule.

We are providing an updated version of the "Human Health Criteria Comparison Table" that reflects these corrections. This does not result in any changes in the preliminary draft rule.
